Lab #03 Class Scope and Accessing Class Members

Names	Haider Ali
Registration Numbers	FA21-BEE-053
Class	3B (BEE)
Instructor's Name	Madam Asma Bibi

Lab Assessment

Pre-Lab	In-Lab	Post Lab			Total
		Data Presentation	Data Analysis	Writing Style	

Lab Tasks

5.1. Code the example given above and check the errors if you try to access the private data members in main () function.

```
#include<iostream>

using namespace std;

class add //Specifies the class
{
private:
    int iNum1, iNum2, iNum3; //Member data

public:
    void input(int iVar1, int iVar2) //Member function
    {
        cout<<"Functions to assign values to the member data"<<endl;
        iNum1=iVar1;
        iNum2=iVar2;
    }

    void sum(void) //Member function
    {
        cout<<"Functions to find the sum of two numbers"<<endl;
        iNum3=iNum1+iNum2;
    }

    void disp(void) //Member function
    {
        cout<<"The sum of the two numbers is "<<iNum3<<endl;
```

```
}  
};  
  
//////////main function of the program//////////  
  
int main()  
{  
    add A1;  
    int iX, iY;  
    cout<<"Input two numbers"<<endl;  
    cin>>iX;  
    cin>>iY;  
    A1.input(iX, iY);  
    A1.sum();  
    A1.disp();  
    system("pause");  
}
```

Output:

```
C:\Users\CI-3\Documents\lab 03.exe
Input two numbers
25 20
Functions to assign values to the member data
Functions to find the sum of two numbers
The sum of the two numbers is 54
Press any key to continue . . .
```

5.2. Modify the above task by making the scope of public member functions as private. Create access functions in public scope to access private member functions from main ().

```
#include<iostream>
```

```
using namespace std;
```

```
class add //Specifies the class
```

```
{
```

```
private:
```

```
int iNum1, iNum2, iNum3; //Member data
```

```
void input(int iVar1, int iVar2) //Member function
```

```
{
```

```
cout<<"Functions to assign values to the member data"<<endl;

iNum1=iVar1;

iNum2=iVar2;;

}

void sum(void) //Member function

{

cout<<"Functions to find the sum of three numbers"<<endl;

iNum3=iNum1+iNum2;

}

void disp(void) //Member function

{

cout<<"The sum of the three numbers is "<<iNum3<<endl;

}

public:

void newint ( int h, int m){

    input(h,m);

}

void sum_public(){

    sum();

}

void disp_only(){

    disp();

}
```

```
};
```

```
//////////main function of the program//////////
```

```
int main()
```

```
{
```

```
    add A1;
```

```
    int iX, iY;
```

```
    cout<<"Input two numbers"<<endl;
```

```
    cin>>iX;
```

```
    cin>>iY;
```

```
    A1.newint(iX, iY);
```

```
    A1.sum_public();
```

```
    A1.disp_only();
```

```
    system("pause");
```

```
}
```

1:36 PM 10/13/2022

Output:

5.3. Code the example given above and include a private constructor in the class. Create objects of this class. Test the code and write down how the constructor will be called or unable to be called?

```
#include<iostream>

using namespace std;

class add //Specifies the class
{
private:
    int iNum1, iNum2, iNum3; //Member data

    add(int v, int b) : iNum1(v), iNum2(b){ }

public:
    //add(int v, int b) : iNum1(v), iNum2(b){ }

    void sum(void) //Member function
    {
        cout<<"Functions to find the sum of two numbers"<<endl;
        iNum3=iNum1+iNum2;
    }

    void disp(void) //Member function
    {
        cout<<"The sum of the two numbers is "<<iNum3<<endl;
    }
};

//////////main function of the program//////////

int main()
{
```

```

int iX, iY;

cout<<"Input two numbers"<<endl;

cin>>iX;

cin>>iY;

add A1(iX, iY);

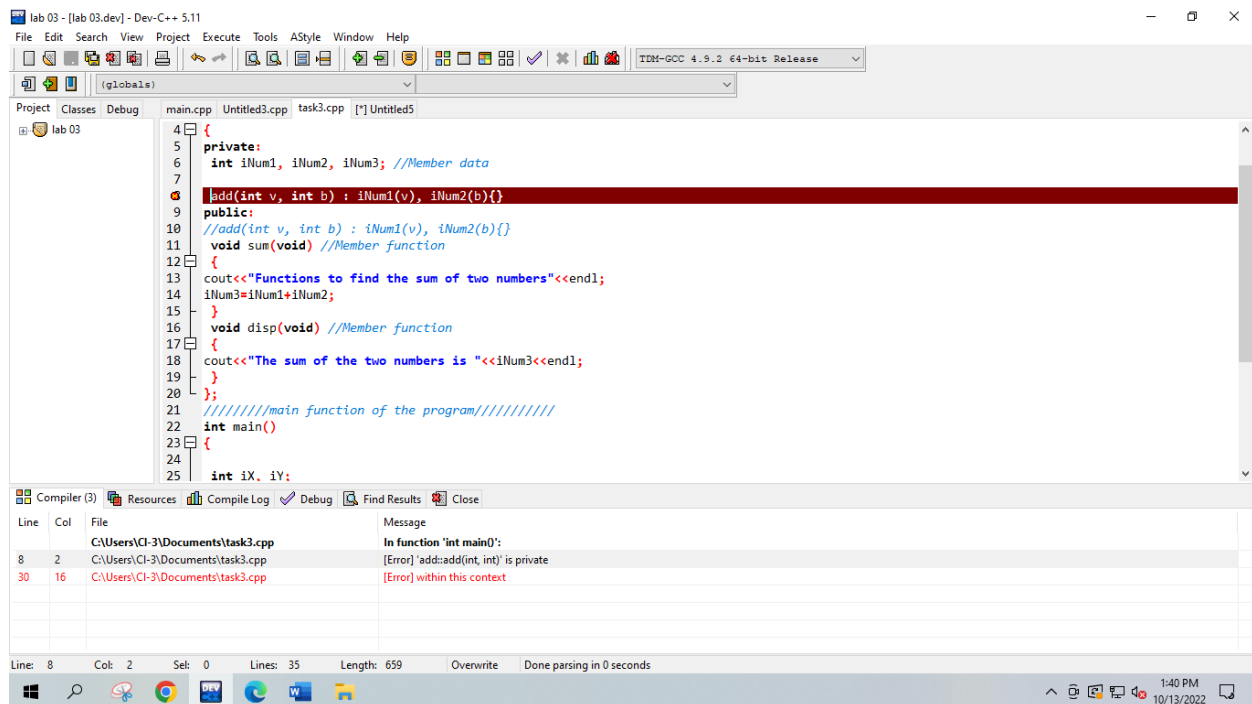

A1.sum();

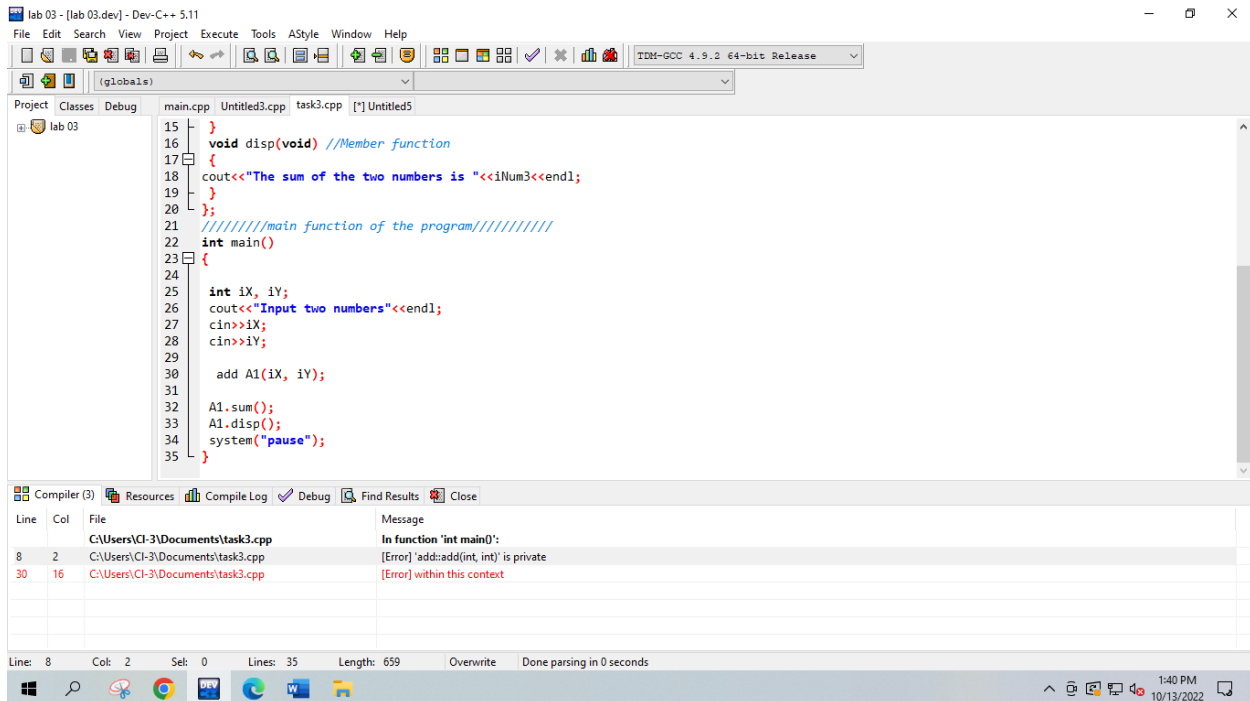

A1.disp();

system("pause");

}

```

- If we initialize the constructor in private, we are unable to call it from main function when we create an object and it gives error during compilation.

If we initialize the constructor in public then it will be called from main function when we create an object and it can be executed successfully.

```

#include<iostream>
using namespace std;
class add //Specifies the class
{
private:
    int iNum1, iNum2, iNum3; //Member data

// add(int v, int b) : iNum1(v), iNum2(b){}
public:
    add(int v, int b) : iNum1(v), iNum2(b){}
    void sum(void) //Member function
    {
        cout<<"Functions to find the sum of two numbers"<<endl;
        iNum3=iNum1+iNum2;
    }
}

```

```

    }
    void disp(void) //Member function
    {
    cout<<"The sum of the two numbers is "<<iNum3<<endl;
    }
    };
    ////////////main function of the program//////////
    int main()
    {

    int iX, iY;
    cout<<"Input two numbers"<<endl;
    cin>>iX;
    cin>>iY;

    add A1(iX, iY);

    A1.sum();
    A1.disp();
    system("pause");
    }

```

```

Home Tasks

6.1. Create a class of subtraction having two private data members. Create class methods to get data from users and for subtraction of data members. Use appropriate access modifiers for class methods.

```
1 #include<iostream>
2 using namespace std;
3 class subtraction{
4 private:
5     int frst_f;
6     int scnd_s;
7 public:
8     subtraction(){
9         frst_f = 0;
10        scnd_s = 0;
11    }
12    void get_numbers(int a, int b){
13        cout<<"Enter the 1st number:\n";
14        cin>>a;
15        cout<<"Enter the 2nd number:\n";
16        cin>>b;
17        frst_f = a;
18        scnd_s = b;
19    }
20    void display(){
21        cout<<"The result is: "<<frst_f - scnd_s<<endl;
22    }
23 };
24 int main(){
25     int a, b;
26     subtraction c;
27     c.get_numbers(a,b);
28     c.display();
29     return 0;
30 }

Critical analysis/Conclusions:

In this lab we learn how to access the private data in main function with the help of member functions. Moreover, if we initialize the constructor in private, we are unable to call it from main function when we create an object and it gives error during compilation. If we initialize the constructor in public then it will be called from main function when we create an object and it can be executed successfully. In this lab we found out errors in given example syntax during compilation and made its execution successful.
